Working with Data in Python Cheat Sheet

Reading and writing files

```
Package/Method Description
                                                                                                                                                                                               Syntax and Code Example
                            Syntax: r (reading) w (writing) a (appending) + (updating: read/write) b (binary, otherwise text)
                Different
                modes to
                               1. 1
File opening
                open files
modes
                               1. Examples: with open("data.txt", "r") as file: content = file.read() print(content) with open("output.txt", "w") as file: file.write("Hello, world!") with open("log.txt", "a") as file:
                for specific
                operations.
                             Copied!
                            Syntax:
                               1. 1
                               2. 2
                               3. 3
                               1. file.readlines() # reads all lines as a list
                               2. readline() # reads the next line as a string
                               3. file.read() # reads the entire file content as a string
                Different
                             Copied!
                methods to
                read file
File reading
                            Example:
methods
                content in
                various
                               1. 1
                ways.
                               2. 2
                               3. 3
                               4. 4
                               1. with open("data.txt", "r") as file:
                                      lines = file.readlines()
                               3.
                                      next line = file.readline()
                                      content = file.read()
                               4.
                             Copied!
                            Syntax:
                               1. 1
                               2. 2

    file.write(content) # writes a string to the file

                               2. file.writelines(lines) # writes a list of strings to the file
                Different
                             Copied!
                write
File writing
                methods to
                            Example:
methods
                write
                content to a
                               1. 1
                file.
                               2. 2
                               3. 3
                               1. lines = ["Hello\n", "World\n"]
                               2. with open("output.txt", "w") as file:
                                      file.writelines(lines)
                             Copied!
Iterating over
                Iterates
                            Syntax:
lines
                through
                each line in
                the file
                               1. for line in file: # Code to process each line
                using a
                             Copied!
                `loop`.
```

```
Example:
                               1. 1
                               2. 2
                               1. with open("data.txt", "r") as file:
                               2. for line in file: print(line)
                             Copied!
                            Syntax:
                               1. 1
                               2. 2
                Opens a
                               1. file = open(filename, mode) # Code that uses the file
                               2. file.close()
                file,
                performs
                             Copied!
                operations,
Open() and
                and
                            Example:
close()
                explicitly
                closes the
                               1. 1
                file using
                               2. 2
                the close()
                               3.3
                method.
                               1. file = open("data.txt", "r")
                               2. content = file.read()
                               3. file.close()
                             Copied!
                            Syntax:
                               1. 1
                               1. with open(filename, mode) as file: # Code that uses the file
                Opens a file
                using a with Copied!
                block,
with open()
                 ensuring
                            Example:
                automatic
                               1. 1
                file closure
                after usage.
                               1. with open("data.txt", "r") as file:
                               2. content = file.read()
                             Copied!
Pandas
Package/Method
                                                                    Description
                Reads data from a `.CSV` file and creates a DataFrame.
.read csv()
                Reads data from an Excel file and creates a DataFrame.
.read excel()
```

Syntax and Code Example

Syntax: dataframe_name = pd.read_csv("filename.csv") Example: df = pd.read_csv("data.csv")

Syntax:

- 1. 1
- 1. dataframe_name = pd.read_excel("filename.xlsx")

Copied!

Example:

1. 1

1. df = pd.read_excel("data.xlsx")

.to_csv() Writes DataFrame to a CSV file. Access Columns Accesses a specific column using [] in the DataFrame. describe() Generates statistics summary of numeric columns in the DataFrame. Removes specified rows or columns from the DataFrame. axis=1 indicates columns. axis=0 indicates rows. drop()

```
Syntax:
```

- 1. 1
- 1. dataframe_name.to_csv("output.csv", index=False)

Copied!

Example:

- 1. 1
- 1. df.to_csv("output.csv", index=False)

Copied!

Syntax:

- 1. 1
- 2. 2
- 1. dataframe_name["column_name"] # Accesses single column
- 2. dataframe_name[["column1", "column2"]] # Accesses multiple columns

Copied!

Example:

- 1. 1
- 2. 2
- 1. df["age"]
 2. df[["name", "age"]]

Copied!

Syntax:

- 1. 1
- dataframe name.describe()

Copied!

Example:

- 1. 1
- df.describe()

Copied!

Syntax:

- 1. 1
- 2. 2
- 1. dataframe_name.drop(["column1", "column2"], axis=1, inplace=True)
- 2. dataframe_name.drop(index=[row1, row2], axis=0, inplace=True)

Copied!

Example:

- 1. 1
- 2. 2
- 1. df.drop(["age", "salary"], axis=1, inplace=True) # Will drop columns
- 2. df.drop(index=[5, 10], axis=0, inplace=True) # Will drop rows

```
Syntax:
                                                                                                                                           1. 1

    dataframe name.dropna(axis=0, inplace=True)

                                                                                                                                         Copied!
dropna()
                 Removes rows with missing NaN values from the DataFrame. axis=0 indicates rows.
                                                                                                                                        Example:
                                                                                                                                           1. 1
                                                                                                                                           1. df.dropna(axis=0, inplace=True)
                                                                                                                                         Copied!
                                                                                                                                        Syntax:
                                                                                                                                           1. 1

    dataframe_name.duplicated()

                                                                                                                                         Copied!
duplicated()
                 Duplicate or repetitive values or records within a data set.
                                                                                                                                        Example:
                                                                                                                                           1. 1
                                                                                                                                           1. duplicate_rows = df[df.duplicated()]
                                                                                                                                         Copied!
                                                                                                                                        Syntax:
                                                                                                                                           1. 1
                                                                                                                                           1. filtered_df = dataframe_name[(Conditional_statements)]
                                                                                                                                         Copied!
Filter Rows
                 Creates a new DataFrame with rows that meet specified conditions.
                                                                                                                                        Example:
                                                                                                                                           1. 1
                                                                                                                                           1. filtered_df = df[(df["age"] > 30) & (df["salary"] < 50000)</pre>
                                                                                                                                         Copied!
                                                                                                                                        Syntax:
                                                                                                                                          1. 1
                                                                                                                                          2. 2
                                                                                                                                           1. grouped = dataframe_name.groupby(by, axis=0, level=None, as_index=True,
                                                                                                                                           sort=True, group_keys=True, squeeze=False, observed=False, dropna=True)
                 Splits a DataFrame into groups based on specified criteria, enabling subsequent aggregation, transformation, or analysis within Copied!
groupby()
                 each group.
                                                                                                                                        Example:
                                                                                                                                           1. 1
                                                                                                                                           1. grouped = df.groupby(["category", "region"]).agg({"sales": "sum"})
                                                                                                                                         Copied!
head()
                 Displays the first n rows of the DataFrame.
                                                                                                                                        Syntax:
                                                                                                                                           1. 1

    dataframe_name.head(n)
```

```
Example:
  1. 1

    df.head(5)

Copied!
Syntax:
  1. 1
  1. import pandas as pd
Copied!
Example:
  1. 1
  1. import pandas as pd
Copied!
Syntax:
  1. 1

    dataframe_name.info()

Copied!
Example:
  1. 1
  1. df.info()
Copied!
Syntax:
  1. 1
  1. merged_df = pd.merge(df1, df2, on=["column1", "column2"])
Copied!
Example:
  1. 1
  1. merged_df = pd.merge(sales, products, on=["product_id", "category_id"])
Copied!
Syntax:
  1. 1
  1. print(df) # or just type df
Copied!
Example:
  1. 1
  2. 2
```

Replaces specific values in a column with new values. replace()

tail() Displays the last n rows of the DataFrame.

Numpy Package/Method Description **Syntax and Code Example** Syntax: 1. 1 1. import numpy as np Copied! Importing NumPy Imports the NumPy library. Example: 1. 1 1. import numpy as np Copied! Creates a one or multi-dimensional array, Syntax: np.array() 1. 1 2. 2 1. array_1d = np.array([list1 values]) # 1D Array
2. array_2d = np.array([[list1 values], [list2 values]]) # 2D Array Copied! Example: 1. 1 2. 2

```
    print(df)

  2. df
 Copied!
Syntax:
  1. 1
  1. dataframe_name["column_name"].replace(old_value, new_value, inplace=True)
Copied!
Example:
  1. 1
  1. df["status"].replace("In Progress", "Active", inplace=True)
Copied!
Syntax:
  1. 1
```

Copied!

Example:

1. 1

df.tail(5)

dataframe_name.tail(n)

```
1. array_1d = np.array([1, 2, 3]) # 1D Array
                                                              2. array_2d = np.array([[1, 2], [3, 4]]) # 2D Array
                                                            Copied!
                                                            Example:
                                                              1. 1
                                                              2. 2
                                                              3. 3
                     - Calculates the mean of array elements
                     - Calculates the sum of array elements
Numpy Array Attributes - Finds the minimum value in the array

    np.mean(array)

                     - Finds the maximum value in the array
                                                              np.sum(array)
                     - Computes dot product of two arrays
                                                              3. np.min(array
                                                              4. np.max(array)
                                                              np.dot(array_1, array_2)
```
